

In the first sprint:

1. **Identify one or more topics** (you can develop a proposal for more than one topic - usually though the topic that you pick should be the one with the best proposal, or the proposal that you found easiest to develop.
2. **Develop a short proposal including answers to the following questions:**
 - A. **Problem** description: What are you trying to do?
 - B. **Reason:** Why is this problem interesting to you or others?
 - C. **Constraints:** Which difficulties do you foresee (technical, conceptual, personal)?
 - D. **Goals** (and non-goals): What deliverable(s) are you going to develop? If you have more than one goal, order them by importance. Add a list of non-goals, i.e. goals that you are most likely not going to achieve.
 - E. **Metrics:** How are you going to measure if your project is successful or not?
 - F. **References:** Which sources have you used to develop the proposal? Your sources should be consistently cited (e.g. AMA formatted), and complete (author, title, date, place of publication). Software, videos, personal communication and blogs also count as sources and references.
 - G. **Comments:** Optionally, share your free form thoughts or concerns about this project, including perhaps which other projects you were considering before settling on this one.
